

SMART CREDIT JIRA PROJECT

To manage our **Smart Credit Kiosk FYP** on this board, we have structured the project into three main **Epics: Hardware, Software, and ML**. Each Epic is broken down into specific **User Stories** and sub-tasks, which are then assigned to team members and prioritized.

By using the **"Group: Assignee"** view shown in your screenshot, you can easily monitor the high-priority tasks assigned to each person, ensuring that critical components like the ML model (SCRUM-11) move efficiently from **To Do** to **Done**.

The **Jira Backlog** for your "Smart Credit Kiosk" project, where tasks are categorized into your three core epics: Hardware, Software (Bilingual UI), and ML. It displays the prioritized queue of upcoming stories, such as thermal printer configuration and ML prediction mapping, currently awaiting assignment or movement into an active sprint.

The **Jira Timeline** and **Backlog** for your "Smart Credit Kiosk" FYP, structured into three primary epics: Hardware & Biometrics, Bilingual UI, and AI & Data. The timeline illustrates the scheduled duration for these epics across January and February, while the backlog lists specific prioritized stories—such as printer configuration and ML logic mapping—linked to their respective categories to ensure organized project completion.

Overall, Jira acts as a central hub for our **Smart Credit Kiosk** project, allowing us to break down complex Epics into manageable tasks while tracking real-time progress. It ensures team accountability through assigned roles and clear prioritization, helping us meet FYP deadlines systematically.
